These subunits group themselves in oligomeric structures that can be divided in two classes: the globular forms and the asymmetric or elongated forms. Toxicological profile for methyl parathion. These insecticides generally do not accumulate in tissues.

In the following centuries, the use of CWAs was diversified, progressively. Atropine is effective in the treatment for all OPCs, being adopted as standard antidote since the end of the decade of until the present, in spite of the continuous research for new antidotes. Since the late s, hundreds of OP compounds have been made and commercialized worldwide as insecticides in a variety of formulations. The principles of medical treatment of OPCs victims are the same applied to victims of intoxications by any other toxic substance, that is, termination of exposure to the toxic agent; establishment or maintenance of appropriate ventilation; administration of adequate antidotes, if available; and, finally, correction of cardiac Toxicology of Organophosphate & Carbamate Compounds. After decontamination, initial patient assessments should be directed at Biomarkers.
